1. Introduction to the Case Study

With the rapid growth of e-commerce and digital services, online platforms have become an essential medium for businesses to reach customers. The fashion industry has also adopted digital solutions to improve accessibility, convenience, and customer engagement. One emerging concept is **fashion rental platforms**, where customers can rent designer outfits for specific occasions instead of purchasing them.

This case study presents the design and development of **StyleRent**, a web-based platform that allows users to browse designer collections and rent outfits online. The system is developed using **HTML, CSS, and JavaScript**, which are widely used technologies for building interactive and responsive web applications.

The website provides multiple features such as browsing fashion collections, viewing lookbooks, booking outfits for rent, and contacting the platform for inquiries. The objective of this project is to demonstrate the use of **frontend web technologies** to create an attractive and functional user interface for an online rental service.

The system focuses on **user-friendly navigation, responsive design, and interactive features**, ensuring a smooth experience for users across different devices.

2. Problem Statement / Case Background (Abstract)

Traditional fashion shopping requires customers to purchase expensive outfits that may only be worn once or twice. This creates issues such as high costs, limited wardrobe variety, and unnecessary clothing waste.

To address these challenges, the **StyleRent platform** is designed as a digital solution where users can **rent designer outfits for special occasions** such as weddings, parties, and events.

The main problem addressed in this case study is:

How to design and develop an interactive and user-friendly web platform that allows users to browse fashion collections and book designer outfits online for rental purposes.

The proposed system enables users to:

- Browse various designer outfits.
- View fashion collections through lookbooks.
- Calculate and book outfit rentals.
- Contact the platform for inquiries or support.

The project demonstrates how **HTML, CSS, and JavaScript can be integrated to create a responsive and visually appealing web application** for an online rental service.

3. Problem Statement / Case Study Design

The StyleRent website follows a **multi-page website architecture** where each page provides a specific functionality.

System Components

The system consists of the following pages:

1. Home Page (index.html)

The home page introduces the platform and displays a **hero banner**, navigation menu, and a brief overview of the service.

Features:

- Brand logo and navigation bar
 - Hero banner image
 - Call-to-action buttons
 - Links to other pages
-

2. Lookbook Page (lookbook.html)

The lookbook page showcases **fashion images and outfit inspirations**.

Features:

- Display of fashion collection images

- Grid-based layout
 - Visual presentation of designer outfits
-

3. Collections Page (product.html)

This page displays **available outfits for rent**.

Features:

- Outfit images
 - Collection listings
 - Product style showcase
-

4. Booking Page (booking.html)

The booking page allows users to **rent an outfit by filling out a form**.

Features:

- Customer name input
 - Outfit selection
 - Rental duration
 - Form submission
-

5. Contact Page (contact.html)

This page enables users to **send inquiries or contact the business**.

Features:

- Contact form
 - User details input
 - Message submission
-

System Architecture

The project follows a **three-layer structure**:

1. **Presentation Layer**
 - HTML pages

- User interface design
 - 2. **Styling Layer**
 - CSS for layout, colors, and responsiveness
 - 3. **Interaction Layer**
 - JavaScript for dynamic behavior and interactivity
-

4. Methods & Algorithms Technology Applied in the Case Study

The system uses **front-end web development technologies** to implement its functionality.

1. HTML (HyperText Markup Language)

HTML is used to structure the website and define page elements such as:

- Navigation bars
- Images
- Forms
- Sections and layouts

Example HTML structure:

```
<nav class="navbar">
  <a href="index.html">Home</a>
  <a href="lookbook.html">Lookbook</a>
  <a href="product.html">Collections</a>
  <a href="booking.html">Book Now</a>
</nav>
```

HTML ensures proper page organization and accessibility.

2. CSS (Cascading Style Sheets)

CSS is used to design the visual appearance of the website.

Main CSS features used:

- Layout design
- Grid and flexbox
- Responsive design
- Color themes
- Typography styling

Example CSS snippet:

```
.navbar {  
  display: flex;  
  justify-content: space-between;  
  background-color: black;  
  color: white;  
}
```

CSS improves **user experience and visual attractiveness**.

3. JavaScript

JavaScript adds **interactivity and dynamic behavior** to the website.

Functions implemented include:

- Navigation menu toggle
- Form validation
- Dynamic interactions

Example JavaScript logic:

```
const navToggle = document.getElementById("navToggle");  
const navLinks = document.getElementById("navLinks");  
  
navToggle.addEventListener("click", () => {  
  navLinks.classList.toggle("active");  
});
```

JavaScript enhances usability by allowing user interaction without reloading pages.

4. Responsive Web Design

Responsive design techniques ensure the website works on:

- Desktop computers

- Tablets
- Mobile devices

This is achieved using:

- CSS media queries
 - Flexible layouts
 - Adaptive image sizes
-

5. Problem Statement / Case Study Implementation Details and Snapshots

The implementation of the StyleRent website includes multiple components working together.

Key Implementation Features

1. Navigation Bar

A responsive navigation bar is implemented across all pages.

Functions:

- Page navigation
- Mobile menu toggle

2. Hero Banner

The home page displays a hero banner image that promotes the fashion rental service.

Purpose:

- Attract user attention
- Highlight brand identity

3. Fashion Lookbook

The lookbook page uses **image grids** to present fashion styles visually.

Benefits:

- Visual engagement
 - Easy browsing experience
-

4. Booking Form

The booking page allows customers to submit rental requests.

Inputs include:

- Customer name
 - Outfit selection
 - Rental duration
-

5. Contact Form

Users can submit queries through a contact form.

Features:

- Name input
 - Email input
 - Message field
-

6. Problem Statement / Case Study Results and Conclusion

The StyleRent web application successfully demonstrates how **frontend technologies can be used to build a functional fashion rental website.**

The system achieves the following outcomes:

- Provides an intuitive user interface for browsing outfits.
- Allows users to explore fashion collections through lookbooks.

- Enables outfit booking through a structured form.
- Provides communication through a contact page.
- Offers responsive design for multiple devices.

The project highlights the effectiveness of **HTML, CSS, and JavaScript in creating interactive web applications** without the need for complex backend systems.

In conclusion, the StyleRent platform demonstrates a **simple yet effective digital solution for fashion rental services**, improving accessibility and convenience for users. Future improvements may include:

- User authentication systems
 - Online payment integration
 - Database connectivity
 - Admin dashboard for inventory management
-
